My Internship Report for GoldenAge Technologies

Name: Ayub Nasir
University: ASTU
Project: Internship Finder

Project Overview:

The project aims to solve the gap between students/internship seekers and companies.
Key features of the platform include:

- Company account creation and internship listings

- Internship seeker profiles

- Application and proposal system

- Review system after internship completion

- Dashboard for managing internships, applications, and profiles

My Contributions:

-As a frontend developer I've implemented most of the UI, including the registration flow and the company dashboard and integrated it with the backend api.

-I've helped and left suggestions for our UI designer. Ensured designs were both practical for implementation and consistent with the overall UX vision.

-And also as a Full-stack developer I was helping the backend team with technical issues, discussing and debugging issues together.

- Acted as the team lead, organizing tasks and responsibilities among members.

- Maintained GitHub project structure and reviewed PRs when necessary.

What I've Learned:

Team Collaboration Using GitHub:

- Learned how to collaborate effectively with teammates using branches, pull requests, and code reviews.

- Gained experience in resolving merge conflicts and managing version control.

- Improved my Figma knowledge, especially Auto Layout, which helped in building scalable and responsive designs.

- Improved my skills in integrating APIs and managing client-side state in real-world scenarios.

- Gained experience in handling real-time data interactions and error management.

Challenges we faced:

- We initially faced issues connecting our API to MongoDB Atlas, we tried to resolve it but it wasn't unless we used VPN therefore we concluded that it might be teles problem and As a solution, we decided to migrate our backend database to PostgreSQL, which provided a more stable and reliable experience during development.

That's it for now!
